EM/8 DATA CENTER MANAGEMENT

TAKING SERVICENOW® INNOVATION TO DATA CENTERS

Adding Visualization, Monitoring, Automation, Capacity Management
to Make Data Center Work Flow

EM/8 provides data center monitoring and management functionality, integrated with ServiceNow. EM/8 uses ServiceNow configuration management, incident management and workflow natively and adds visualization and monitoring of IT and facility equipment. EM/8 collects power, utilization and temperature information, provides trend lines, history, graphs and aggregations. EM/8 can generate trouble tickets based on thresholds or errors from the data collection. All data collection is done out of band without the need to install any agents on any existing hardware.

EM/8 further includes capacity management functionality, heat maps, and device placement recommendations when integrated with PAR4®.

Patented runbook automation can be enabled to dynamically turn on and off equipment, adjust server capacity to variable load and shift applications automatically from one data center to another, based on pre-defined schedules, power cost, outside events, or for maintenance purposes.
